Instructions

Dear Students,

I hope all is well. I, Ali Haider, your course instructor for Multivariable Calculus, am writing to provide a quick summary of the third week's lectures and some important instructions.

In the third week, we developed a solid understanding of important topics such as polar coordinates, the area of curve in polar and Cartesian coordinate; We discussed these concepts with a basic introduction and foundational explanations. Please try to grasp these topics, as they will be helpful for the lectures in the upcoming week.

Below are some practice questions for you to solve. Please make an effort to solve these questions independently. However, if you encounter any difficulties, feel free to reach out to me for assistance.

Important Note: Further, I would like to remind you about the quiz scheduled for next week. As previously announced, the quiz will take place during the first lecture of the week (or the second lecture for Section A). The quiz will cover all the material included in the syllabus I have sent you weekly, as well as the assignment questions.

Practice Questions

- **Chapter 11:** *Calculus of Parametric Curves*
- **Exercise:** 11.2
- **page:** 669
- **21 to 24**
- **Exercise:** 11.3
- **Page:** 674
- **Questions:** 5 to 10

- **Exercise:** 11.5
- **Page:** 682
- **Questions:** 1 to 4

These questions are from the textbook *Thomas' Calculus*. Please attempt all the questions and reach out if you need clarification or further guidance.

Next Week's Plan

Next week, we will complete some questions from Exercise 11.5 and start a new topic: **conic section**.

Contact Information

For any questions or concerns, feel free to contact me after 4:00 PM via email or in person.
