
Digital Marketing (BUS-300)

Quiz: 1 (Solution)

Date: 15-10-2025

Instructor: Nimra Abbas

Total Marks: 20

Time Hour: 30 minutes

Name: _____

Reg. No: _____

Question:1**[3+4+4]****Short Questions:**

1.) What is the difference between domain and hosting? Mention the names of reliable service providers.

Solution:

A domain is the address of a website that users type into a browser, such as www.example.com. It helps people locate a website on the internet. Hosting is the service that provides space on a server where all website files, images, and databases are stored. It makes the website accessible online.

In simple words, the domain is the address, and hosting is the place where the website lives.

Reliable Service Providers

Domain providers: GoDaddy, Namecheap, Google Domains

Hosting providers: Bluehost, Hostinger, SiteGround, AWS

2.) Write down the steps involved in Domain Ownership and Transfer.

Solution:

Domain Ownership (Registration):

1. Choose a unique domain name.
2. Check availability through a domain registrar.
3. Register the domain by providing owner details.
4. Make payment and verify your email.
5. Domain ownership is confirmed and the domain becomes active.

Domain Transfer (from one provider to another):

1. Unlock the domain from the current registrar.
2. Get the authorization (EPP) code.
3. Submit a transfer request to the new registrar.
4. Approve the transfer through confirmation email.
5. After verification, the domain is transferred and ownership is updated.

3.) What are the Do's and Don'ts of buying a domain name?

Solution:

Do's:

- Choose a short, simple, and easy-to-remember domain name.
- Use a name that matches your brand or business purpose.
- Prefer common extensions like .com, .org, or .pk.
- Check for trademark and social media availability before buying.
- Buy from a reliable registrar (e.g., GoDaddy, Namecheap).

Don'ts:

- Don't use long, complex, or hard-to-spell words.
- Don't include numbers, hyphens, or confusing spellings.
- Don't copy or imitate existing famous brands.
- Don't choose a name that limits future business growth.
- Don't ignore renewal costs and ownership details.

Question:2

[3+3+3]

Scenario Based Questions:

Scenario 1 : Sara purchased a domain from one company and hosting from another. She installed WordPress successfully, but the site isn't loading with the domain name.

Question: What step might she have missed during setup? Justify your answer.

Solution:

Sara most likely missed connecting the domain to the hosting server by updating the DNS or nameserver settings.

Justification:

When a domain is purchased from one company and hosting from another, the domain must be pointed to the hosting provider's nameservers. If this step is skipped, the domain does not know where the website files are stored, so the site will not load even if WordPress is installed correctly. Updating DNS/nameservers links the domain to the hosting server, making the website accessible through the domain name.

Scenario 2 : A student installs a new theme but the website still looks the same as the old one.

Question: What might they have forgotten to do after installing the theme?

Solution:

They most likely forgot to activate the new theme after installing it.

Justification:

Installing a theme only adds it to WordPress, but the website design does not change unless the theme is activated. The site will continue to display the old theme until the new one is activated from the WordPress dashboard.

Scenario 3 : Ali wants to create a personal portfolio website. He has chosen a domain name and purchased hosting. After connecting the domain to the hosting, when he types the domain in the browser, it still shows “Page Not Found.”

Question: What are two possible reasons this could happen and how can he fix it?

Solution:

Two possible reasons are:

1. WordPress or website files are not installed in the correct directory.

If no website is installed in the root folder (public_html), the server shows “Page Not Found.”

To Fix: Install WordPress properly or upload website files into the correct main directory.

2. DNS propagation is not complete yet.

After connecting a domain to hosting, it can take a few minutes to 24 hours for changes to fully update worldwide.

To Fix: Wait for DNS propagation to complete and then refresh the site.
