Digital Marketing (BUS-300)

Final Term: Fall 2025

Date: 19-11-25

Instructor: Nimra Abbas

Total Marks: 25 (12 + 13)

Time Allowed: 20 minutes

Name: Tayyab Mahmood.

Registration No: F2023-470.

Part I : Theory Part (To be solved in the provided space below)

Duration: The duration of this part is 20 minutes

Plagiarism: Plagiarism will result in zero marks

No Questions: Asking questions during the exam is not allowed

Prohibited Items: Smartwatches and cell phones are strictly forbidden

Question # 1	CLO 2	[Marks: 3+3+3+3]
--------------	-------	------------------

Question 1: Attempt the following

A company launches a limited-time promotional campaign on its website. During the campaign, the team notices unusual behavior:

- ❖ The website becomes slow, especially when many users visit at the same time. *bandwidth*
- ❖ Some customers receive a warning message before entering the site. *security*
- ❖ A few users report that the website briefly redirected them to another page, but the issue disappeared after refreshing. *broken link*
- ❖ Product images on some pages fail to load. *bandwidth - missing slow*
- ❖ The checkout page stops responding occasionally.
- ❖ The hosting provider sends an automated notification: "Unusual resource usage detected. Performance threshold exceeded."
- ❖ A few features of the website stop working after the owner recently installed several new plugins.
- ❖ The website dashboard also loads slower than usual for the admin.

Answer the following based on above scenario:

1. Based on the scenario, identify any four possible issues that could be causing the website to behave abnormally. Explain why you selected each issue.

- Bandwidth bought is low not enough to manage this level of users.
- Hosting was either shared or cheap which ~~led~~ to lead to low speed.
- Warning message produced was due to lack of security either SSL certification
- leading to redirect to different page either cyber attack or broken link.

(3)

2. The website slows down when many users visit at the same time. What might be the technical reasons behind this behavior?

Bandwidth is ~~enough~~ not enough to pass on to the users on the website. eg. log bandwidth would not be ~~enough~~ enough to provide enough interface or high speed to thousands of users.

✓ (3)

3. Some customers see a warning message before entering the site. What does this warning likely indicate, and why is it important?

→ Lack of security, eg no SSL certificate or existing cyber attack due to which browser warned. They need to fix it or website data ~~can~~ can be compromised or lost.

(3)

4. The website redirects users once in a while. What potential problem does this suggest? Provide a likely cause and a recommended solution.

could be a broken link or some cyber attack
as no security to inappropriate links could be possibly
redirecting. Security and bandwidth needs to be
fixed through SSL and hosting provider, Or wordfence.
