

# Software Engineering for CS

## Week 6

---

INSTRUCTOR : DR. NATASH ALI MIAN

School of Computer and Information Technology

**Beaconhouse National University**

\

---

Switch off mobile phones  
during lectures,  
or  
put them into silent mode

---

Process ?

Why we define processes?

Consistent,

Human dependency (Minimize)

Burger, Variations in taste

A solid orange horizontal bar at the bottom of the slide.

# Process Support

---

One way to minimize errors in the requirements engineering is to use process models and to use CASE tools

The most mature CASE tools support of well-understood activities such as programming and testing and the use of structured methods

Support for requirements engineering is still limited because of the informality and the variability of the process

# CASE Tools for RE

---

Modeling and validation tools support the development of system models which can be used to specify the system and the checking of these models for completeness and consistency

Management tools help manage a database of requirements and support the management of changes to these requirements

# Process Improvement

---

Process improvement is concerned with modifying processes in order to meet some improvement objectives

Improvement objectives

- Quality improvement
- Schedule reduction
- Resource reduction

# Planning Process Improvement

---

Some important questions arise:

What are the problems with current processes?

What are the improvement goals?

How can process improvement be introduced to achieve these goals?

How should process improvements be controlled and managed?

# RE Process Problems

---

Lack of stakeholder involvement

Business needs not considered

Lack of requirements management

Lack of defined responsibilities

Stakeholder communication problems

Over-long schedules and poor quality requirements documents

# Process Maturity

---

Process maturity can be thought of as the extent that an organization has defined its processes, actively controls these processes and provides systematic human and computer-based support for them

The SEI's Capability Maturity Model is a framework for assessing software process maturity in development organizations

# Capability Maturity Model

Initial – Every organization

---

# CMM Level 1: Initial

---

Organizations have an undisciplined process and it is left to individuals that how to manage the process and which development techniques to use

# CMM Level 2: Repeatable

---

Organizations have basic cost and schedule management procedures in place. They are likely to be able to make consistent budget and schedule predictions for projects in the same application area

# CMM Level 3: Defined

---

The software process for both management and engineering activities is documented, standardized and integrated into a standard software process for the organization

# CMM Level 4: Managed

---

Detailed measurements of both process and product quality are collected and used to control the process

# CMM Level 5: Optimizing

---

The organization has a continuous process improvement strategy, based on objective measurements, in place

# Best Practices for RE Process Improvement

---

RE processes can be improved by the systematic introduction of best requirements engineering practices

Each improvement cycle identifies best practice guidelines and works to introduce them in an organization
