Digital Marketing (BUS-300)

Quiz: 1

Date: 15-10-2025

Instructor: Nimra Abbas

Total Marks: 20

Time Hour: 30 minutes

Name: _____

Reg. No: _____

Question:1

Solution of Quiz

[3+4+4]

Short Questions:

1.) What is the difference between domain and hosting? Mention the names of reliable service providers.

Solution:

=> A domain is the website's address (e.g., www.example.com) that users type in their browser to visit the site.
=> Hosting is the server space where your website's files, data, and content are stored and made accessible online.

=> Reliable domain/hosting providers: Hostinger, the bee host, etc

2.) Write down the steps involved in Domain Ownership and Transfer.

Solution:

- If domain doesn't suit your business, it can be sold/transferred to others.
- Transfer process involves:
 - 1) Contacting your domain registrar/hosting provider.
 - 2) Sharing credentials securely.
 - 3) Registrar handles the ownership transfer.
- Transfer can be lengthy, details usually handled by hosting company.

3.) What are the Do's and Don'ts of buying a domain name?

Solution:

- Avoid numbers unless part of your brand (e.g McDonald's, not McDonald1)
- Avoid special characters (e.g, &, \$, etc). These are also not allowed.
- Hyphen (-) is allowed but not recommended.
- For example: K & N's domain is written as K and Ns .pk without special characters.

Question:2

[3+3+3]

Scenario Based Questions:

Scenario 1 : Sara purchased a domain from one company and hosting from another. She installed WordPress successfully, but the site isn't loading with the domain name.

Question: What step might she have missed during setup? Justify your answer.

Solution:

- She likely missed connecting the domain with the hosting server.
- When the domain is bought from one company and hosting is bought from another company, you must update the "DNS" or "name servers" of the domain to point to the hosting provider.
- without correct DNS setting, the domain won't know where the website is hosted, so the site won't load.

Scenario 2 : A student installs a new theme but the website still looks the same as the old one.

Question: What might they have forgotten to do after installing the theme?

Solution:

- The student likely forgot to "activate" the new theme after installing it.
- In wordpress, simply installing a theme doesn't change the website appearance - it must be activated to apply its design and layout.

Scenario 3 : Ali wants to create a personal portfolio website. He has chosen a domain name and purchased hosting. After connecting the domain to the hosting, when he types the domain in the browser, it still shows "Page Not Found."

Question: What are two possible reasons this could happen and how can he fix it?

Solution:

- Two possible reasons are:
- ① website files not uploaded or wordpress not installed - If the hosting server is empty, the browser shows "Page not found". This can be fixed by installing the wordpress properly or upload the website files.
 - ② DNS or nameserver settings not fully ~~prop~~ propagated - It can take time for the domain to point to the hosting server. To fix this, one needs to wait for DNS propagation (usually up to 24 hours) or verify the nameserver configuration.
