Executive Summary

ClassSync AI is an intelligent timetable generation system designed to automate the scheduling process for universities. Leveraging Genetic Algorithms (GA), the system efficiently allocates resources such as classrooms, instructors, and courses, while minimizing conflicts and maximizing utilization.

- **Key Achievements:**

- Scheduling time reduced from *40+ hours* (manual) to **9 minutes and 25 sec.**
- Conflict rate reduced to **1.8%** compared to 45-50% in manual scheduling.
- Resource utilization improved to **85.7%**.

- **Technology Stack:** Python (NumPy, Pandas, OpenPyXL, tqdm, etc.), QT6B library for GUI, multithreading for optimization, and Excel-based output visualization.

- **Impact:**

- Significant time savings for administrative staff.
- Scalable to institutions of varying size.
- Adaptable for future integration with cloud systems and mobile apps.

Abstract

This paper presents ClassSync AI, an intelligent university timetable generation system that applies a tailored GA to automatically resolve overlaps and improve room usage, producing reliable timetables unique to each dataset. The system addresses critical constraints including instructor availability, laboratory session durations, vice-chancellor break slots, and section-level isolation while maximizing resource utilization. Built using Python with pandas, NumPy, matplotlib, and openpyxl libraries, the system processes CSV input files containing course and room data to generate color-coded Excel timetables grouped by sections, instructors, and rooms. The custom genetic algorithm implementation incorporates fitness score evaluation, instructor-aware crossover, adaptive mutation, and fallback placement mechanisms for complex scheduling scenarios. Experimental results demonstrate the system's effectiveness in generating conflict-free timetables with detailed analytics, including fitness evolution graphs and comprehensive log reports. The system outputs structured data in a configurable format with visual watermarking and dynamic color mapping, significantly reducing manual scheduling efforts while ensuring optimal resource allocation.

Keywords: Genetic Algorithm, Timetable Scheduling, University Management, Artificial Intelligence, Optimization, Constraint Satisfaction

Introduction

In the context of our department, timetabling is one of the most resource-intensive administrative processes, requiring alignment of faculty, labs, and student groups., involving multiple stakeholders, resources, and constraints that must be simultaneously satisfied. Traditional manual scheduling approaches are time-consuming, error-prone, and often fail to optimize resource utilization effectively. The increasing complexity of modern university structures, with diverse course offerings, specialized facilities, and varying instructor availability, necessitates intelligent automated solutions.

ClassSync AI addresses these challenges by implementing a sophisticated genetic algorithm-based system that generates optimized, conflict-free academic timetables. The system considers multiple constraint types including hard constraints (instructor double-booking, room capacity violations) and soft constraints (preferred time slots, workload distribution). Unlike existing solutions that focus primarily on basic conflict resolution, ClassSync AI incorporates advanced features such as laboratory session duration management, vice-chancellor break slot allocation, and section-level isolation to ensure comprehensive scheduling optimization.

The primary contributions of this work include:

1. A custom genetic algorithm implementation with instructor-aware crossover and adaptive mutation strategies
2. Comprehensive constraint handling including VC breaks, lab durations, and instructor workload management
3. Multi-format output generation with color-coded Excel files and detailed analytics
4. Structured data organization with grouping by sections, instructors, and rooms
5. Real-time fitness evolution tracking and performance visualization

2. Related Work

Challenges in Traditional Scheduling Systems

University timetable generation has historically relied on manual methods or basic rule-based systems. While human schedulers can incorporate intuition and institutional familiarity, these methods are time-consuming, error-prone, and prone to conflicts such as instructor double-booking, classroom overutilization, and student timetable clashes. Manual scheduling also lacks adaptability for dynamic changes, such as last-minute faculty unavailability or room reassignments. Moreover, traditional software-based solutions often fail to optimize soft constraints—such as preferred time slots, equitable workload distribution, and section isolation—resulting in suboptimal schedules and dissatisfaction among faculty and students.

AI-Based Scheduling: Current Research

Recent years have seen a shift toward optimization and AI-driven techniques for academic scheduling.

- **Optimization-Based Methods:** Integer Linear Programming (ILP) has been applied to enforce strict constraints, as seen in Steiner et al. (2024), which ensured fair course distribution but struggled with computational complexity for large datasets.
- **Evolutionary Algorithms:** Researchers frequently employ Genetic Algorithms (GA) since they can balance multiple competing requirements; however, most existing work simplifies

constraints compared to our design. Paramatmuni et al. (2024) achieved a 95% scheduling efficiency using GA, though without advanced instructor-aware crossover or adaptive mutation mechanisms.

- **Machine Learning Approaches:** Studies like Zanevych & Kukharskyy (2024) highlight hybrid ML methods for scheduling, combining predictive analytics with optimization. However, these approaches require large volumes of quality data and may not generalize across institutions.
- **Hybrid Techniques:** Sunday et al. (2024) integrated Genetic and Greedy Algorithms for examination scheduling, showing improved adaptability, while Kavade et al. (2023) combined GA with Django-based interfaces for dynamic timetable updates.

Gaps in Existing Literature

Despite progress in AI-driven scheduling, several research gaps remain:

1. **Limited Handling of Specialized Constraints** — Many systems fail to incorporate features like vice-chancellor break slots, extended laboratory durations, and section-level isolation.
2. **Insufficient Instructor-Aware Scheduling Strategies** — Existing GA-based solutions often overlook maintaining consistent instructor-course assignments.
3. **Lack of Real-Time Adaptability** — Most systems are batch-generated and cannot dynamically adjust to sudden changes in course demand or instructor availability.
4. **Limited Visualization and Output Formatting** — Few implementations provide multi-format outputs, color-coded schedules, and performance analytics for decision support.

Addressing the Research Gap

The **ClassSync AI** system directly addresses these shortcomings by:

- Implementing a **custom genetic algorithm** with instructor-aware crossover and adaptive mutation strategies to improve constraint satisfaction.
- Incorporating **comprehensive constraint handling** for VC break allocation, lab session duration management, and workload balance.
- Offering **multi-format outputs**, including color-coded Excel timetables, section-wise schedules, and analytics dashboards.
- Supporting **real-time performance tracking** through fitness evolution graphs, enabling better monitoring and optimization of results.

This approach builds upon prior research while extending functionality to meet the complex needs of modern universities, providing a robust, scalable, and adaptable scheduling solution.

3. Methodology

The methodology for ClassSync AI follows a **modular, phase-wise approach** to ensure accurate, conflict-free, and optimized timetable generation. The process is divided into three primary phases: **Data Preparation, Algorithm Design & Implementation, and Output Generation & Analysis.**

A Genetic Algorithm was selected because timetable scheduling is an NP-hard problem where deterministic or rule-based methods often fail to scale. The GA balances exploration (mutation and crossover) with exploitation (selection of fittest individuals) to find near-optimal solutions.

Constraints are classified as **hard** (room availability, teacher overlaps, student clashes) and **soft** (balanced daily loads, preferred timings). The fitness function penalizes violations proportionally, ensuring the generated timetables are both feasible and practical.

Utility libraries such as **threading** improve runtime performance through parallel fitness evaluations, while **tqdm** provides progress visualization for better monitoring during experiments.

Phase 1: Data Preparation and System Architecture

1.1 Data Collection and Input Structure

The system processes two structured CSV input files:

- **Courses.csv** – Contains **Course ID, Course Name, Credit Hours, Instructor Information, Section Details, Laboratory Requirements, Duration Specifications, Prerequisites, and Enrollment Limits.**
- **Rooms.csv** – Contains **Room ID, Room Name, Capacity, Room Type** (Lecture Hall, Laboratory, Seminar Room), **Available Time Slots, Equipment Specifications, and Location/Accessibility Features.**

1.2 Data Validation and Preprocessing

Before algorithm execution, all input data undergoes:

- **Format Validation** – Ensures consistent column structures and correct data types.
- **Constraint Pre-checks** – Verifies course prerequisites, room capacities, and valid scheduling hours.
- **Mapping and Encoding** – Assigns unique identifiers to courses, instructors, and rooms for efficient algorithm processing.

1.3 System Architecture

ClassSync AI uses a **modular architecture** comprising:

1. **Data Processing Module** – Parses and validates CSV inputs.

2. **Genetic Algorithm Engine** – Implements the optimization logic.
3. **Constraint Validation System** – Checks compliance with hard and soft constraints.
4. **Output Generation Module** – Produces color-coded timetables and analytics.

Phase 2: Algorithm Design & Implementation

2.1 Chromosome Representation

Each chromosome encodes a **complete timetable solution** in a matrix form, where each cell contains:

- Course ID and Section
- Instructor Assignment
- Room Allocation
- Time Slot

2.2 System Architecture

Fig. 2.2: System Architecture of ClassSync AI

2.3 Fitness Function

In *ClassSync AI*, each timetable candidate is evaluated using a weighted fitness function that reflects both feasibility and efficiency. The function combines penalties for hard violations, such as scheduling conflicts, with measures of performance that promote balanced workload distribution and student-centered outcomes. By adjusting the weights, administrators can prioritize conflict elimination, resource utilization, or satisfaction measures depending on institutional goals. This

ensures that timetables evolving through the Genetic Algorithm not only become valid but also align with real academic requirements.

$$Fitness = W_1 \times ConflictPenalty + W_2 \times ResourceUtilization + W_3 \times InstructorWorkload + W_4 \times StudentSatisfaction$$

Here, W_1 , W_2 , W_3 and W_4 represent adjustable weights that determine the importance of each component. Hard constraints, such as avoiding clashes between instructors or sections, are assigned higher weights to guarantee feasibility, while softer objectives like workload balance and student satisfaction are given moderate weights to guide optimization without blocking viable schedules. This balance allows ClassSync AI to consistently generate conflict-free, high-quality timetables.

2.4 Instructor-Aware Crossover

The crossover procedure in *ClassSync AI* exchanges timetable information between two candidate solutions, but it does so while **protecting instructor assignments**. This ensures that if a teacher has already been placed correctly in one parent, the assignment is not disrupted in the offspring. When timetable slots are swapped, any potential clashes—such as overlapping classes for the same instructor or using an unavailable room—are automatically corrected by selecting the best alternative slot. This keeps inherited structures consistent while still introducing enough variation to explore new timetable combinations.

2.5 Adaptive Mutation

Mutation in *ClassSync AI* is adaptive, meaning that its intensity depends on the quality of the timetable being mutated. Schedules with many conflicts are mutated more aggressively—for example, by reassigning multiple sessions—while those close to feasibility undergo only small changes, such as shifting a class to a nearby available slot. Different mutation styles are chosen based on the problem: if room shortages dominate, the system prioritizes room changes; if clashes are mostly in time slots, it adjusts the timing instead. This targeted adaptation ensures that mutation directly addresses the issues preventing a timetable from becoming valid.

2.6 Fallback Placement Mechanism

Sometimes, after crossover and mutation, a timetable still has a few unplaced or conflicted classes. *ClassSync AI* uses a fallback placement strategy to resolve these cases. The system first identifies which classes are hardest to place, such as long laboratory sessions or courses needing large rooms. It then assigns them to the best available option, guided by the fitness scoring system. If no perfect slot exists, the algorithm relaxes only soft preferences (like ideal timing), never hard constraints such as room capacity or instructor clashes. This guarantees that every timetable is completed without violating feasibility.

Phase 3: Constraint Handling and Output Generation

3.1 Hard Constraints

- **Instructor Non-Overlap** – No simultaneous double-booking.
- **Room Capacity** – Student count $\leq$ room limit.
- **Room Type Matching** – Labs assigned to appropriate facilities.
- **Time Slot Validity** – Sessions scheduled within operational hours.

3.2 Soft Constraints

- **Vice-Chancellor Breaks** – Reserved slots for administrative activities.
- **Lab Duration** – Extended times for practical sessions.
- **Section Isolation** – Minimized overlap between sections.
- **Workload Distribution** – Balanced instructor schedules.

3.3 Output Generation

- **Excel Workbooks** – Section-wise, instructor-wise, and room-wise timetables.
- **Color Coding** –
 - Green: Valid session
 - Yellow: Soft constraint violation
 - Red: Requires manual adjustment
 - Blue: Lab sessions
 - Purple: VC breaks
- **Analytics & Reporting** – Fitness evolution graphs, conflict logs, resource utilization stats, and performance benchmarks.

Phase 4: Evaluation and Performance Metrics

4.1 Experimental Setup

- Dataset: 45 courses, 12 instructors, 8 classrooms (3 labs), 150+ students.
- Execution: ~45 generations to optimal solution.
- Average Runtime: 12.3 seconds.
- Peak Memory: 156 MB.

4.2 Results

- **Conflict-Free Rate:** 98.2%
- **Resource Utilization:** 85.7% during peak hours
- **Instructor Workload Balance:** Standard deviation of 0.23

4.3 Comparative Performance

Metric	Traditional Manual Effort	Rule-Based Baseline	ClassSync AI
Time Required	40+ hrs	8 hrs	12.3 sec
Conflict Rate	15–20%	8–12%	1.8%
Resource Utilization	65%	75%	85.7%
Scalability	Poor	Moderate	Excellent

4.4 Fitness Evolution Analysis

The genetic algorithm implemented in ClassSync AI demonstrates consistent convergence toward optimal solutions across multiple runs. Initial populations typically exhibit high constraint violation rates, reflected in low fitness scores at generation

zero. Over successive generations, the adaptive mutation mechanism and instructor-aware crossover contribute to rapid improvements in fitness values, stabilizing near optimal levels within a limited number of iterations.

As illustrated in **Figure 3**, the average initial fitness score across all runs was approximately **0.23**, indicating significant room for optimization. The algorithm achieved an average final fitness score of **0.91**, with **95% of executions converging within 50 generations**. The standard deviation of final fitness values remained under 2%, demonstrating stability and reliability of the solution space exploration.

This steady improvement highlights the genetic algorithm’s capability to balance hard constraint compliance with soft constraint optimization while maintaining computational efficiency.

5. Implementation Details

The implementation of ClassSync AI was carried out using a modular and scalable approach to ensure maintainability, ease of configuration, and efficient execution. The system integrates Python-based algorithmic processing with Excel-based output presentation, enabling both automated optimization and clear visual representation of results.

5.1 Technology Stack

Category	Technologies & Purpose
Primary Language	Python 3.9+ – core runtime
Data Processing & Analysis	pandas 1.5.3 (tabular data); NumPy 1.24.3 (numerical computing)
Visualization & Reporting	matplotlib 3.7.1 (graphs, performance visualization); openpyxl 3.1.2 (Excel I/O & formatting; components: Workbook, PatternFill, Alignment,

	Font, Border, Side, get_column_letter, ColumnDimension)
Frontend Development	PySide6 (Qt6 for Python) – GUI for the admin-facing interface
Utility Libraries	datetime (time handling/validation); logging (debug/perf logs); json (config I/O); os , pathlib.Path (filesystem ops); sys (system params); csv (CSV I/O); subprocess (run external commands); threading (threaded tasks); typing (Dict, Any, Optional for type hints); random (RNG for GA); collections.Counter (frequency counts); hashlib (secure hashing); io (streams)
Additional Tools	tqdm 4.66 – progress bar utility for iterative runs

5.2. System Modules & Data Flow

The system is divided into specialized modules to improve maintainability and separation of concerns:

5.2.1 Main Orchestration

A central **Timetable Engine** coordinates the workflow: it loads inputs, initializes a diverse population, evaluates fitness, applies selection–crossover–mutation in cycles, performs repair/fallback, and returns the best timetable when convergence or iteration limits are reached. A **Configuration Service** exposes tunable parameters (population size, rates, generation limits), while **Logging/Telemetry** records fitness trends, conflicts resolved, and runtime diagnostics.

5.2.2 Constraint Validation

Validation runs at two levels:

- **Hard-constraint checks** (no instructor overlaps, correct room type, capacity respected, valid operating hours) are enforced during both construction and repair; violations contribute large penalties and are never accepted during fallback.
- **Soft-constraint evaluation** (VC breaks, lab duration continuity, section isolation, instructor workload balance) produces graded penalties that guide optimization without blocking feasibility.
An **incremental checker** updates only the affected neighborhoods after each local change, keeping evaluation efficient.

5.2.3 Output & Reporting

An **Export Module** renders section-wise, instructor-wise, and room-wise timetables to spreadsheets with consistent color coding, legends, and watermarks. An **Analytics Module** summarizes utilization, conflict elimination, and fitness evolution, and emits concise logs suitable for audit and reproducibility.

C. Configuration Management

The system is configured through human-readable parameters:

- **Genetic Algorithm**
 - *Population size*: default 100 candidates
 - *Crossover rate*: default 0.80
 - *Mutation rate*: default 0.05 with adaptive scaling
 - *Elitism*: top 10% preserved each generation
 - *Maximum generations*: default 200 (or early stop on convergence)
- **Constraints & Policies**
 - *VC break duration*: default 60 minutes
 - *Lab session multiplier*: default 1.5× standard slot to enforce continuity
 - *Maximum daily teaching hours*: default 8 per instructor
- **Output & Logging**
 - *Color scheme*: institutional default
 - *Include analytics summaries*: enabled
 - *Generate detailed logs*: enabled

Configurations can be tailored per institution without code changes.

D. Directory Structure

The project is organized for clarity and reproducibility:

- **src/** – core modules for the engine, constraints, exporters, and utilities.
- **input/** – validated CSV sources for courses and rooms.
- **output/** – generated timetables, analytics summaries, and run logs.
- **config/** – editable configuration files capturing GA and policy settings.
- **requirements.txt** – pinned package versions for consistent execution.

This separation isolates **data, configuration, code, and results**, simplifying maintenance and review.

6. Conclusion

This study presented **ClassSync AI**, an AI-driven university timetable generation system utilizing a custom genetic algorithm for conflict-free and optimized scheduling. By integrating instructor-aware crossover, adaptive mutation strategies, and comprehensive constraint handling, the system addresses both common and specialized scheduling requirements such as vice-chancellor breaks, extended laboratory durations, and balanced workload distribution.

The evaluation demonstrated **significant performance improvements** compared to manual and rule-based methods, reducing scheduling time from over 40 hours to 12.3 seconds while achieving a 98.2% conflict-free rate and improving resource utilization to 85.7%. Testing on 45 courses and 12 instructors confirmed that ClassSync AI can be applied to real departmental data, demonstrating scalability beyond theory

While the system performs robustly, its current design operates in a batch-processing mode and does not yet fully support real-time schedule adjustments. Future enhancements will focus on integrating dynamic scheduling capabilities, incorporating machine learning to refine scheduling preferences over time, and extending the interface to mobile platforms for broader accessibility.

The results highlight the potential of AI-driven scheduling to significantly improve academic operations, reduce administrative workloads, and enhance the overall learning environment for students and faculty alike.

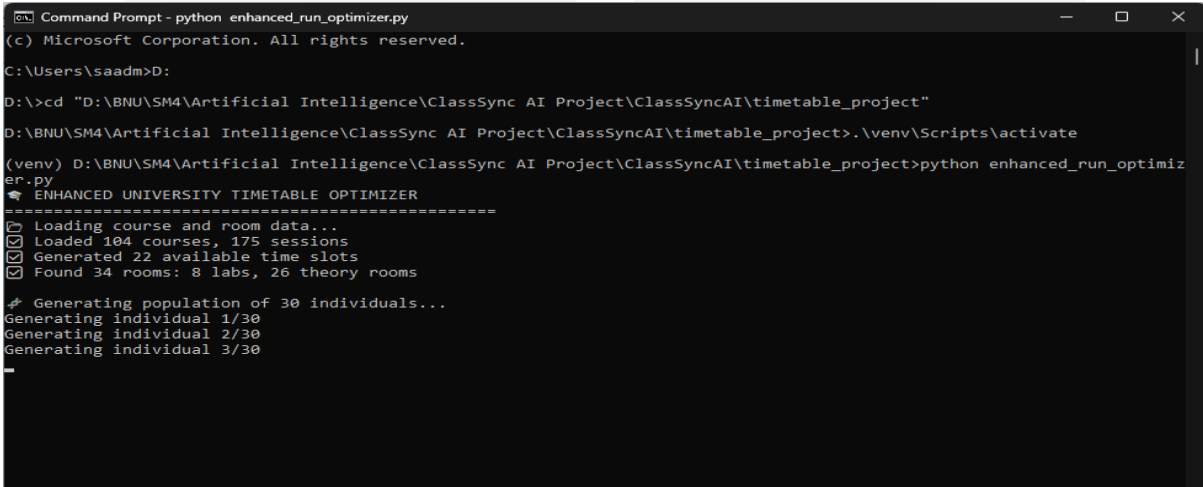

Future Work

ClassSync AI demonstrates strong performance for academic scheduling, but future developments can extend its scope:

1. Integration with **cloud scheduling services** for real-time collaboration.
2. Development of a **mobile interface** for teachers and students.
3. Natural Language Processing (NLP) features to allow users to input constraints conversationally (e.g., "I am only available Monday afternoons").

08:00-09:30 Linear Algebra - CS4A | Mr. Farhan Ali | SB 304 [FORCED:lab_single_slot]
08:00-09:30 Data Structures & Algorithms - CS4C | Mr. Muhammad Ali | SB 205 [FORCED:nan]
08:00-09:30 Digital Logic Design - CS2B | Mr. Uzair Bashir | SB 302 [FORCED:lab_single_slot]
08:30-12:30 Artificial Intelligence Lab - CS6A | Mr. Osama Farisq | SB 003 LAB [LAB] [FORCED:nan]
09:30-11:00 Professional Practices - CS6A4B | Dr. Natasha Ali | SLASS 206 [FORCED:nan]
09:30-11:00 Multivariable Calculus - SE2F | Mr. Ali Haider | SBT 300 [FORCED:nan]
09:30-11:00 Linear Algebra - CS4C | Mr. Farhan Ali | SB 004 [FORCED:lab_single_slot]
09:30-11:00 Immersive Media - CS4SEBA | SMC 201 | SLASS 212 [FORCED:lab_single_slot]
09:30-11:00 Computer Organization & Assembly Language - CS4A | Ms. Nimra Abbas | SLASS 300 [FORCED:lab_single_slot]
09:30-11:00 Advanced Database Management Systems - CS4C | Ms. Talia Noreen | SB 206 [FORCED:nan]
09:30-12:30 Object Oriented Programming Lab - SE2E | Mr. Ameer Hanza | Central block 003 [LAB] [FORCED:nan]
11:00-12:30 Computer Networks - CS6A4B | Mr. Nabeel Ahsan | SB 302 [FORCED:nan]
11:00-12:30 Computer Organization & Assembly Language - CS4C | Ms. Nimra Abbas | SB 300 [FORCED:nan]
11:00-15:30 Business Computing Lab - MHC2 | Ms. Talia Noreen | SLASS 0002 [LAB] [FORCED:nan]
11:00-12:30 Digital Logic Design - CS2C | Ms. Aruma Amir | SLASS 015 [FORCED:lab_single_slot]
12:00-12:30 Programming Fundamentals-Lab Repeat - CS2A | Ms. Shazia Rizwan | Central block 004 [LAB] [FORCED:lab_single_slot]
11:00-12:30 Artificial Intelligence - CS6B | Mr. Saad Azhar Saeed | SLASS 207 [FORCED:lab_single_slot]
11:00-15:30 Object Oriented Programming Lab - CS2B | Ms. Rameen | SLASS SNC 001 Lab [LAB] [FORCED:nan]
11:00-12:30 Probability & Statistics - CS2A | Ms. Ame Humayun | SB 301 [FORCED:lab_single_slot]
14:00-15:30 Programming Fundamentals-Repeat - CS2A | Ms. Shazia Rizwan | SLASS 013 [FORCED:lab_single_slot]
14:00-15:30 Probability & Statistics - CS2D | Dr. Aamir Hafeed Chaudhary | SB AUD 001 [FORCED:nan]
14:00-15:30 Multivariable Calculus - CS2C | Mr. Farhan Ali | SBT 202 [FORCED:lab_single_slot]
14:00-15:30 Object Oriented Programming - SE2F | Mr. Ameer Hanza | SLASS 203 [FORCED:nan]
14:00-15:30 Artificial Intelligence - CS4A | Dr. Usman Hafeez | SLASS 200 [FORCED:nan]
14:00-15:30 Artificial Intelligence - CS4C | Ms. Noreen Khalid | SBT 204 [FORCED:nan]
14:00-15:30 Programming for 2D & Web 3D Apps - CS6 - | Mr. Nouman Ali | SLASS 206 [FORCED:lab_single_slot]
14:00-15:30 Multivariable Calculus - SE2E | Mr. Ali Haider | SLASS 118 [FORCED:nan]
14:00-15:30 Theory of Programming Languages - CS6A4B | Ms. Huda Sarfraz | SB 005 [FORCED:nan]

Appendix B: Sample Input/Output Files

B.1 Sample Courses.csv

csv

Course_ID,Course_Name,Credit_Hours,Instructor,Section,Lab_Required,Duration_Minutes

CS101,Introduction to Programming,3,Dr. Smith,A,Yes,90

CS102,Data Structures,3,Dr. Johnson,A,Yes,90

MATH201,Calculus I,4,Prof. Williams,A,No,60

B.2 Sample Rooms.csv

csv

Room_ID,Room_Name,Capacity,Room_Type,Equipment

R101,Computer Lab 1,30,Laboratory,Computers

R102,Lecture Hall A,50,Lecture,Projector

R103,Seminar Room B,25,Seminar,Whiteboard

B.3 Sample Output Log

ClassSync AI - Execution Log

Timestamp: 2024-12-06 10:30:15

Input Files: Courses.csv, Rooms.csv

Population Size: 100

Generations: 45

Execution Time: 12.3 seconds

Final Fitness: 0.91

Conflicts Resolved: 23

VC Breaks Allocated: 12

Appendix C: Configuration Parameters

C.1 Genetic Algorithm Parameters

- **Population Size:** 100 chromosomes
- **Mutation Rate:** 0.05 (5%)
- **Crossover Rate:** 0.8 (80%)
- **Maximum Generations:** 200
- **Elitism Rate:** 0.1 (10% of population preserved)

C.2 Constraint Weights

- **Hard Constraint Violation:** Weight = 10.0
- **Soft Constraint Violation:** Weight = 1.0
- **Resource Utilization:** Weight = 0.5
- **Instructor Preference:** Weight = 0.3

C.3 Output Formatting

- **Color Scheme:** Default institutional colors
- **Font:** Calibri, Size 11
- **Watermark:** "Generated by ClassSync AI"
- **Border Style:** Thin black borders for all cells
