Step 3

Generate Traffic

Step 4

Analyse the Dashboard

Analysis Questions

Q1: Sessions and Users

Write down your total session count and total user count from the summary cards. If your sessions are higher than your users, what does that tell you? If they are equal, what does that mean?

Ans:

Based on the summary cards, the total session count is 2 and the total user count is 2. Since the counts are equal, it indicates that every visitor accessed the site only once during this period, with no returning sessions from the same individuals.

Q2: Pages per Session

What is your Pages per Session value? Is the average visitor exploring multiple pages or leaving after one? What does this suggest about the site's navigation or content?

Ans:

With an average of 1 page per session, most visitors left after viewing a single page, suggesting the site's navigation or content was not engaging enough to encourage further exploration.

Q3: Scroll Depth

What is your average scroll depth percentage? The Featured Products section on the homepage is placed below the fold. Based on your scroll depth number, what percentage of visitors likely never scrolled far enough to even see those products?

Ans:

With a 100% average scroll depth, most visitors likely viewed the Featured Products section despite it being below the fold.

Q4: Active Time

What is the Active Time shown in your summary cards? Compare it to the total session duration visible in your recordings list. Why are those two numbers different, and what does the gap between them tell you about real visitor engagement on this site?

Ans:

The Active Time was 55 seconds compared to a total session duration of 5.6 minutes, showing that users spent much of the session inactive or passively browsing rather than actively engaging with the site.

Q5: Dead Clicks

Look at the Dead Clicks percentage in the Insights card on your dashboard. Which pages or elements do you think are generating the most dead clicks based on what you know is broken in the site? What is the real-world consequence of a dead click on an 'Add to Cart' button for a real e-commerce business?

Ans:

With a 50% Dead Click rate, users were likely clicking broken or non-responsive elements such as product images or buttons, which can frustrate users and reduce conversions in an e-commerce site.

Q6: Rage Clicks

Check the Rage Clicks percentage in the Insights card. Is it higher or lower than the dead clicks percentage? Given that the Contact form Submit button does nothing when clicked, explain what a visitor clicking it multiple times in frustration tells you about the user experience.

Ans:

With a 0% Rage Click rate, visitors did not repeatedly click elements in frustration, suggesting there were no major interaction issues causing immediate user annoyance.

Rage clicks ⓘ

Q7: Quick Back

Look at the Quick Back percentage. Which page do you think visitors are most likely leaving immediately and why? What would need to change on that page to reduce the Quick Back rate?

Ans:

With a 0% Quick Back rate, visitors were generally not leaving pages immediately, suggesting the product pages provided enough information to keep users engaged.

Quick backs ⓘ

Q8: Device Breakdown

What percentage of your visitors came from mobile versus desktop? If a large portion came from mobile, why does that matter for a site like UrbanCart where the broken buttons and filters may behave differently on a touchscreen?

Ans:

All visitors used desktop devices running Windows, so the current UX issues mainly affect PC users, though they could become worse on touchscreen devices due to tap accuracy and responsiveness problems.

Q9: Traffic Sources

Look at the Referrers or Traffic Sources section. Where did your traffic come from? What does it mean when most of your sessions show as Direct traffic?

Ans:

Most of the website traffic came from Pakistan, indicating that the primary audience accessing the site is located there.

Q10: Overall Reflection

Based on everything you see in the Clarity dashboard, write 3 to 4 sentences summarising the biggest problems this website has from a user experience perspective. If this were a real business, which single issue would you fix first and why?

Ans:

UrbanCart's main UX issues include irrelevant products appearing in categories, confusing dead clicks on product images, weak navigation engagement, and users quickly leaving product pages due to lack of useful information. The most important fix is improving product detail pages, since users leaving those pages directly hurts conversions.
