
Course: HCI & Computer Graphics(CSC-335)

Date: May 22, 2026

Instructor: Sania Khalid

Total Marks: 15

Quiz: 03

Time: 15 Min

Instructions:

- Answer all questions.
 - Write clearly and concisely.
 - Marks are indicated for each question.
-

Q1

[2 + 3 = 5 marks]

A social media app provides no visual feedback when a post fails to upload due to a poor internet connection. Unaware that anything has gone wrong, the user repeatedly taps the **"Post"** button. Once connectivity is restored, six identical duplicate posts appear all at once. Name the error state design principle that is missing in this scenario, and propose a detailed solution that would prevent this experience from occurring.

Q2

[2 + 3 = 5 marks]

A news app displays 14 stories on its homepage, all rendered in the same font size, the same font weight, and the same card size, with no visual distinction between them. Users report feeling overwhelmed and uncertain about where to begin reading. Name the visual design principle that is absent in this layout, and explain how you would redesign the homepage to create a clearer, more guided reading experience.

Q3

[5 marks]

A startup's designer insists on creating fully polished Figma prototypes, complete with brand colours, custom typography, and real images for every round of user testing, regardless of the stage of the project. The team is working under significant time and budget constraints. A senior UX designer recommends switching to paper prototypes for early-stage testing. Drawing on your understanding of low-fidelity prototyping, explain the strategic advantages of this approach and justify why it is the more appropriate choice at this stage of the design process.
