- A graphical authoring tool
- Created by Martin C

Practice : Sequence Construct

Program statements are executed one after the other in a sequence

Example-1

- Write the program logic to print the right most digit of a number

Example-1

- Write the program logic to print the right most digit of a number

START

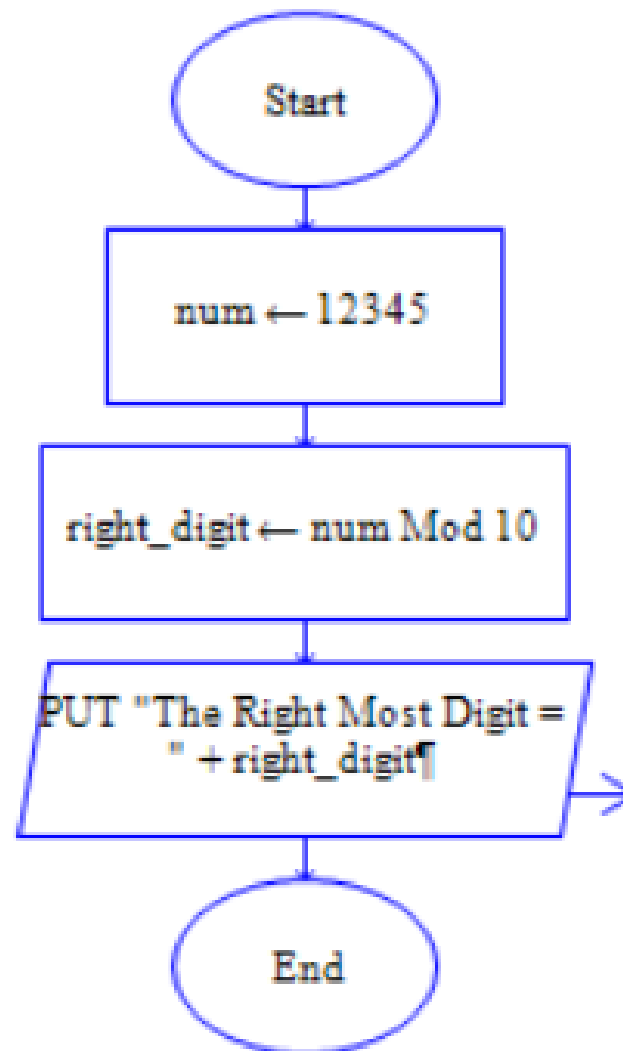

num = 12345

right_digit = num Mod 10

DISPLAY "Right most digit of the number = " + right_digit

STOP

Ex-1

Example-2

- Ask the user to enter total seconds. Convert seconds into minutes and seconds. Display the entered seconds. Display the calculated minutes and seconds.
- If you have 100seconds
- Convert into minutes and seconds?

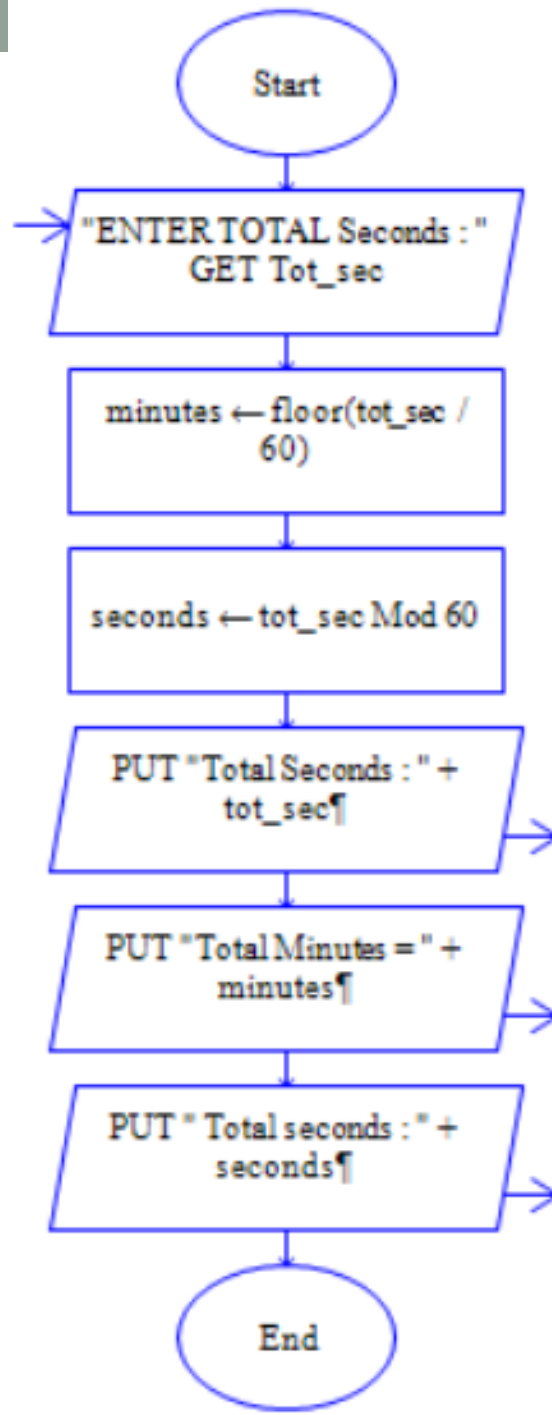

Example-2

- Ask the user to enter total seconds. Convert seconds into minutes and seconds. Display the entered seconds. Display the calculated minutes and seconds.
- If you have 100seconds
- Convert into minutes and seconds?
- $100/60 \rightarrow$ integer quotient = 1
- $100/60 \rightarrow$ remainder = 40
- Therefore: 100 secs = 1 minute and 40 seconds

Ex-2

The / operator is used for division, so $5 / 2$ has the value 2.5

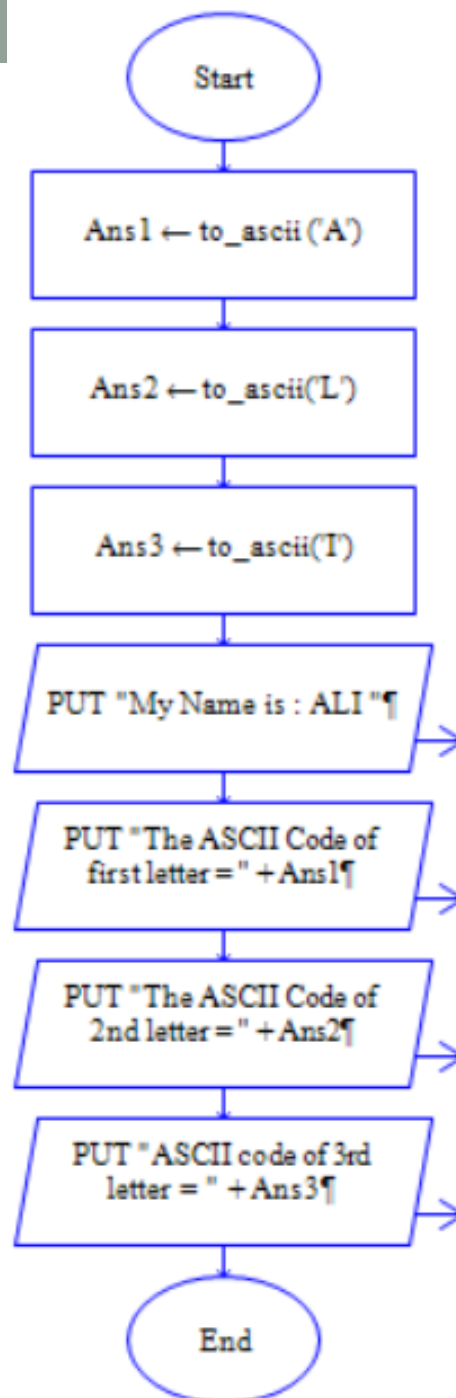

An integer quotient can be found using the floor function:
 $\text{floor}(5 / 2)$

Example -3

- Design a program which converts the name “ALI” into the ASCII codes of each letter

Ex-3

```
MasterConsole
Font  Font Size  Edit  Help
My Name is : ALI
The ASCII Code of first letter = 65
The ASCII Code of 2nd letter = 76
ASCII code of 3rd letter = 73
----Run complete. 9 symbols evaluated.----
```

Example - 4

- Design flow chart which asks user to enter a four digit number (integer)
- Your logic should print each digit separately
- Hint: use `floor` and `Mod` functions

Ex- 4
