

"A lesson taught is a lesson twice learned"

Parkinson's Law states that "**work expands to fill the time available for its completion.**" In the context of studying, this means that if you allocate too much time for a task, you may end up wasting time and working less efficiently. In-order to avoid that:

1. **Set Clear Deadlines:** Break tasks into smaller chunks with specific, shorter deadlines.
2. **Use Time Management Techniques:** Apply methods like the Pomodoro Technique (25-minute focused work sessions) or Feynman Technique.

Feynman Technique:

1. Take a piece of paper and write the concept's name at the Top.
2. Explain the concept using Simple Language. (***Write it down on a piece of paper and simplify the content as much as you can, use examples you've learnt in the class***).
3. Identify problem areas, then go back to the sources to review. (***DON'T MOVE ON UNTIL YOU'VE GRASPED THE CONCEPT***).
4. Pinpoint any complicated terms and challenge yourself to simplify them. (***If reviewing doesn't solve the problem then break it down, use AI to have you explained in chunks with examples***).

▶ How to Learn Faster with the Feynman Technique (Example Included)

Cornell Note Taking Technique:

Efficient for learning because it organizes information into clear sections (notes, cues, and summary), promoting active engagement and better retention.

Main Notes can be taken during the class and the keywords/cues/questions are to be taken when immediate after writing the notes. It refers to the concept that's been written.

After the class gets wrapped up, immediately write the **summary** of what you've learned in the class. It'll help during concept repetition recall what you've learnt during the class.

At home or at the university, **revise** what is learned. With the help of examples and everything, try writing down what is learned exactly on the next page of where the notes taken in the classroom ends.

me and saad

Study Plan:

1. Me and Saad will spend roughly 1-1.5 hours in the library, depending on the course workload. We may allocate additional time in the library for personal projects, hobbies, or other commitments.
2. After studying, we may engage in social activities, sports, or other recreational pursuits.
3. Begin each week by reviewing and revising the previous week's course material.
4. Utilize the **Feynman Technique** to solidify understanding of key concepts.
5. Complete all assigned work (assignments, quizzes, etc.) at home. Consider weekly group study sessions with Saad, potentially on weekends at his place.
6. No formal studying on Thursdays due to a rigorous class schedule and my Fridays may involve extended work hours depending on workload.
7. Dedicate weekends to completing assignments, preparing for quizzes, and reviewing the week's material. As new instructors might take surprise quizzes after each week.
8. Take labs seriously; if using laptops, sit at the back of the lab. Otherwise, sit at the front. It's better to bring a laptop in the lab. Actively listen to instructor instructions before commencing lab assignments.
9. Always remember the challenges faced in the previous semester's vector assignment due to neglecting initial instructions.

Reinstated from the other document:

First Week: Attend all classes casually this week. Observe the teaching style, class dynamics, and get a general feel for each course.

Second Week: After the add/drop period ends, visit each professor's office hours. Spend time discussing the course, your academic goals, and gather specific information about upcoming final projects, particularly for databases, AI, data structures, and the assembly language; as all four of these courses have separate projects.

Third Week & Beyond (Technical Focus): Start gaining insights into how to make your projects special to earn bonus marks. Shift from general observation to focused learning and proactively develop essential skills by testing out knowledge by practical implementation.

1. **Prioritize Quizzes, Assignments, and Lab Vivas:** These components typically carry significant weight in the overall course grade.
2. **Complete Weekly Work on Time:** Avoid postponing any work to the following week.
3. **Regularly Review Lab Assignments:** Conduct a thorough review of each lab assignment at the end of the week. This is crucial since vivas might occur after a two-week period of lab work. This semester rigorous revision is needed to grasp the coding concepts and database schema.
